No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 3, Sequence 3, Sequence 3, Sequence 3, Sequence 3, Sequence 4,

Patent No. 6087108
GENERAL INFORMATION:
APPLICANT: Bandman, Olga
APPLICANT: Goli, Surya K.
TILE OF INVENTION: NOVEL RNA EDITING ENZYME
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
ADDRESSE:
ADDRESSE:
STREET: 3174 POTLER Drive
CITY: Palo Alto
STATE: CA
COUNTRY: USA
SEQUENCE CHARACTERISTICS:
LENGTH: 190 amino acids
TYPE: amino acid
STRANDENESS: single
TOPOLOGY: linear

The present sequence is human activation-induced cytidine deaminase
That settidine activity similar to APOBEC-1. AID has antiallergic,
That settidine activities, and can be used in agene therapy. AID
Treatment of B cell associated imments for identifying drugs for the treatment of B cell associated immunos system disorders, immunodeficiency diseases and allergies, such as immunospobulin A (19A) deficiency disease, 19A nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen immunodeficiency disease, ataxia telanghectasia, common variable immunodeficiency disease, ataxia telanghectasia, common variable in deficiency disease, allergic munodeficiency disease, allergic munodeficiency disease, allergic munodeficiency disease, allergic mannodeficiency disease, allergic and disorder. The DNA sequences cocoding AID may be used for gene therapy and the antibodies to the AID.

The present sequence is mouse activation-induced cytidine deaminase

(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antiallergic,
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
dermatological activities, and can be used in gene therapy. AID

polymucleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergias, such as immunoglobulin A (IBA) deficiency
disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
disease, DiGeorge disease, ataxia telangectasia, common variable
immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
Indeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
leficiency disease, AIDS (auto immunodeficiency syndrome), elevated
leficiency disease, allergias selection disorder. The DNA sequences
concoding AID may be used for gene therapy and the antibodies to the AID
protein may be used for diagnosis and treatment of these disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytckine, cell proliferation or cell differentiation activity or may induce production of other or cell differentiation activity or may induce production of other or continues in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GVHD), in the induction of tumour immunity, myeloid or lympholid cell deficiencies, wound healing and tissue repair, in the treatment of burns, inclisions and ulcers; as well as in treatment of periodontal disease, osteoporosis or osteoarthritis, mediated by

                      Secreted human proteins, useful as vaccine for treating various diseases such as autoimmune disorders (e.g. multiple sclerosis), and nervous system disorders (e.g. stroke)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Evans C;

                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The PNS and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immulating (e.g. as vaccines) or suppressing activity, hemostatic hematopoiesis regulating activity, tissue growth activity, hemostatic activity, adherin/tumor invasion suppressor activity, anti-inflammatory activity, and tumor invasion suppressor activity, and tumor inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or funbition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or function of bacteria, fungi, viruses and other parasites; effecting bodily characteristics such as, e.g. weight, color, skin, etc., effecting blorhythms or caricadic cycles; enhancing fertility; treatment of depression; treatment of pain; hormonal or endocrine activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               55

The proteins and nucleic acids are also useful as food supplements. The present sequence represents a secreted protein of the invention.

The invention relates to isolated polynuclectides (ABA90876-ABA90968 and ABA90980) and encoded proteins (ABB55698-ABB56800), especially collynuclectides SEQ ID NO 1 (ABA90876) and SEQ ID NO 19 (ABA90885) and SEQ ID NO 19 (ABA90885) and SEQ ID NO 19 (ABA90885) and SEQ ID NO 19 (ABB55698) and SEQ ID NO 19 (ABA90885) and SEQ ID NO 19 (ABB55698) and SEQ ID NO 19 (ABB556707) contained in are deposited with the American Type Culture Collection (ATCC) with accession number 98599. The Polynuclectides and encoded polypeptides have neuroportective, activity, inhibin, chemotactic, haemostatic, thrombolytic and anti-inflammatory activity and acting as cytokine modulators, and anti-inflammatory activity and acting as cytokine modulators.

Coupressors. The Polypeptides and polynuclectides are useful in gene therapies, particularly for preventing, treating or ameliorating any of the following diseases: immune deficiency and disorders: e.g. bacterial corrections, autoimmune disorders, cancer, systemic lupus cythematosus or graft-versus-host disease; myeloid or lymphoid cell corrections, autoimmune disorders, cancer, systemic lupus cythematosus or graft-versus-host disease; myeloid or lymphoid cell corrections, wound, burns, incisions and ulcers, osteoporosis or corrections, wound, burns, incisions and ulcers, osteoporosis or neuropathies, e.g. Alzheimer's, Parkinson's disease, Huntington's creamophilia, cardiac infarction or stroke; inflammatory sepsins or systemic inflammatory response syndrome, ischaemia-reperfusion or stroke; inflammatory bowel disease or confortin's disease; or tumours or cancers, pemphigus vulgaris or pemphigus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               56 HVELLFLRYISDWDLDPGRCYRVTWFTSWSPCYDCARHVADFLRGNPNLSLRIFTARLYF 115

The expression of RNA-associated proteins is closely associated with reproductive tissues, nervous tissues, cell proliferation including cancer, inflammation and immune responses, and so they may be used for diagnosis, treatment or prevention of cell proliferative, immune/inflammatory disorders, and reproductive disorders. Diseases and disorders which may be treated include actinic keratosis, atherosclerosis, arteriosclerosis, bursitis, cirrhosis, hepatitis, mixed connective tissue disease, myelofibrosis, paroxysomal nocturnal hemoglobinuria, polycythermia vera, psoriasis, primary thrombocythemia and cancers, and trauma.

                                                                                                                                                                                                                                                                                                                                                                                                       q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The human RNA editing enzyme (REE) is used in a pharmaceutical carrier for the treatment of cancer, viral diseases and circulatory system tisocders. The enzyme is used in vivo for the correct processing of RNA transcripts of genes e.g. change of a codon in apolloporotein B (apoB) RNA to give a 100 and 48 kDa product transcribed from the same failure of apo B editing leads to excessive apoB 100 production and PNA processing include aberrant alpha-galactosidase processing in RNA processing include aberrant alpha-galactosidase processing in recombinantly to treat related disorders. It can also be used to raise antibodies for immuno-based detection of REE expression levels
                                                                                                                                                                                                                                                                                               65 ISDWDLDPGRCYRVTWFTSWSPCYDCARHVADFLRGNPNLSLRIFTARLYFCEDRKAEPE 124

This sequence represents the human RNA editing enzyme REE-2. CDNA encoding REE-2 was initially isolated in a prostate tumour cDNA library, with the cDNA encoding the present sequence representing a consensus. CEP-2 has chemical and structural homology with the human apobe mRNA editing protein HEPR (28% identity), the rat HEPR homologue REPR (30% identity), and a portion of the mRNA editing enzyme phorbolin I (43% identity). REE-2 was found to be expressed in a variety of CDNA libraries, a high proportion of which were derived from tumours, neuronal CEPE-2 is therefore thought to be associated with the development of cancer, autoimmune disorders, circulatory system disorders (e.g. cancer, autoimmune disorders, circulatory system disorders (e.g. chypercholesterolaemia), viral infections and neurological diseases (e.g. chiparismatosis). REE-2 or its nucleic acids may be used in the diagnosis, treatment and prevention of such diseases via the modulation of transcript editing, which in turn has effects on the encoded protein contacts and alteration in protein activity). The invention specifically contacts and alteration and protein activity. The invention specifically contacts are altered and and activity and a second and and activity and a second and and activity and a second and activity and a second and activity and a second and activity and and activity activity activity and activity and activity and activity activity activity and activity activity activity activity and activity activity activity and a

                                                                                                                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with noctropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and thrombolytic activity, arthritis and inflammation, leukaemias and constraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              65 ISDWDLDPGRCYRVTWFTSWSPCYDCARHVADFLRGNPNLSLRIFTARLYFCEDRKAEPE 124

The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders including hyperproliferative disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. athroacelerosis), blood-related disorders (e.g. hammatory disorders (e.g. infertility) and infectious disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                               The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of alagnosis, treatment, prevention and/or prognosis of a wide range of immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. arthma), cardiovascular disorders (e.g. atherosclerosis), blood related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FYFQFKNLWEANDRNETWLCFTVEGIKRRSVVSWKT--GVFRNQVDSETHCHAERCFLSW 106

The invention relates to human RNA metabolism proteins (RMEP) and their corresponding cDNA molecules. RMEP and its DNA are used for diagnosing, treating and preventing nervous system disorders (epilepsy, dementa, stroke, Alzheimer's disease, Huntington's disease, Parkinson's disease); prion diseases; fatal familial insomnia, nutritional and metabolic diseases of the nervous system; inherited, metabolic, endocrine and coxic myopathy; mental disorders; autoimmune/inflammatory disorders)

amnesia and Tourette's disorder; autoimmune/inflammatory disorders (AIDS-aquired immune deficiency syndrome, allergies, anaemia, asthma, gout, atherosclerosis, Crohn's disease, diabetes mellitus, glomerulonephritis, atherosclerosis, pancreatitis, systemic lupus erythematosis, circhosis, inflammatosis, systemic lucarative disorders (cancer arthritis, osteoporosis, circhosis, inflammatosis); call proliferative disorders (cancer arteriosclerosis, circhosis, hepatitis, psoriasis); and developmental disorders (renal tubular acidosis). RMEP DNA is useful in drug screening techniques, gene therapy and for creating transgenic animals. The present

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. athritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood related disorders (e.g. themophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ISDWDLDPGRCYRVTWFTSWSPCYDCARHVADFLRGNPNLSLRIFTARLYFCEDRKAEPE 124

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                A; Molecule type: mRNA
A; Residues: 1-229 <OSU>
C; Comment: This protein belongs to the cytidine deaminase gene family.
C; Superfamily: apolipoprotein B mRNA editing enzyme, catalytic chain 1
C; Keywords: hydrolase; zinc finger
F; 48-96/Region: zinc finger HHCC motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; Introns: 6/1; 15/2; 148/1; 187/3
